

Spoken language is a complex system that involves the production and comprehension of sounds and words. The process of language acquisition is a gradual one, starting from the first sounds and words in infancy and continuing through childhood and adulthood. The study of language acquisition is a multidisciplinary field that draws on insights from linguistics, psychology, and neuroscience. This paper explores the various factors that influence language acquisition, including the role of the environment, the innate capacity for language, and the social context in which language is learned. It also discusses the challenges faced by individuals with language disorders and the importance of early intervention. The paper concludes by highlighting the ongoing research in this field and the potential for future discoveries.
